

The rise of CloudOps

Marek Wiewiórka, Tomasz Gambin, Agnieszka Szmurło

October 2024

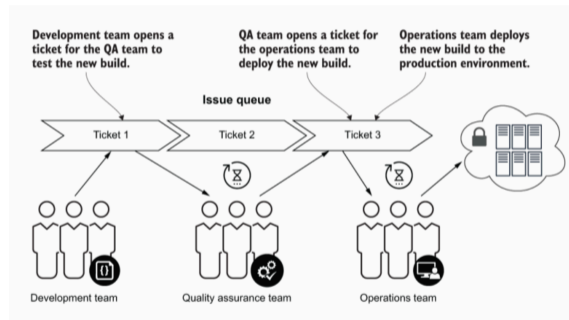

Agenda

1. What is CloudOps?
2. FinOps
3. GitOps and other XOps
4. Automation to the rescue

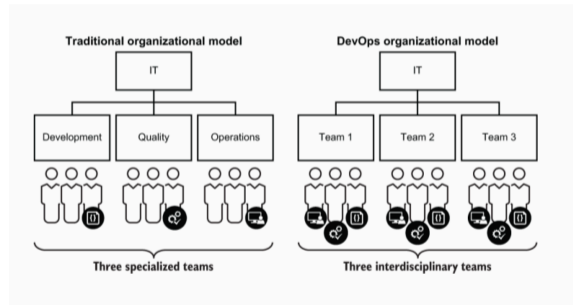

„Traditional“ Ops

separation of:

- ▶ software development (Dev)
- ▶ quality assurance (QA)
- ▶ infrastructure configuration (IT Ops)
- ▶ software deployment (IT OPs)

- ▶ *DevOps* is a set of software development practices that combine software development (Dev) and IT operations (Ops) to shorten the system development life cycle while delivering features, fixes, and updates frequently in close alignment with business objectives.
- ▶ *Automation* is a core principle for achieving DevOps success and CI/CD is a critical component.

CloudOps = DevOps for cloud computing

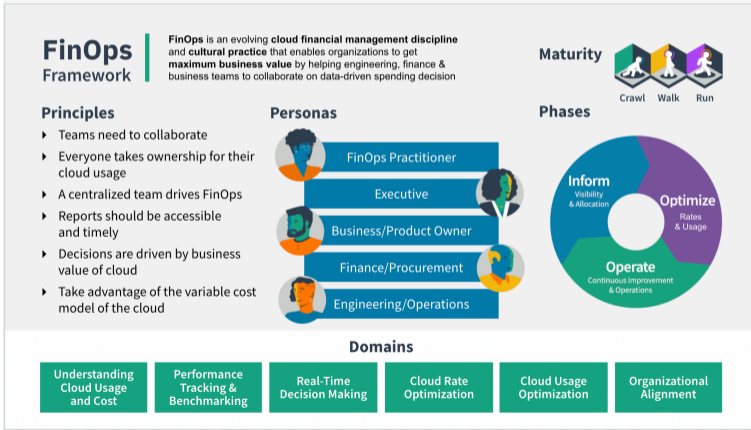

- ▶ lack of available cloud-related ops skills
- ▶ growing complexity - e.g. multicloud
- ▶ rising security threats - public clouds
- ▶ the shift to a utility consumption model - cloud cost management

- ▶ IaC and automation
- ▶ monitoring and logging
- ▶ security
- ▶ cost management

FinOps

“If it seems that FinOps is about *saving* money, then think again.
FinOps is about *making* money.”

GCP - Cloud billing report

- ▶ *SKU* is the resource used by your service, e.g. for Cloud Storage:
 - ▶ class A operations (object adds, bucket/object list)
 - ▶ class B operations (object gets, retrieve bucket/object metadata)
 - ▶ Monthly amount of data retrieved
 - ▶ Monthly data transfer from Cloud

other cost factors include:

- ▶ Standard, Nearline, Coldline or Archive storage class
- ▶ total size of bucket

GCP resource labeling for costs breakdown

```
resource "google_storage_bucket"
↳ "tbd-staging-bucket" {
  name =
  ↳ "${var.project_name}-staging"
  location = var.region
  uniform_bucket_level_access =
  ↳ false
  force_destroy = true
  labels = {
    env = var.environment
    workload_type = "etl_pipeline"
    team = "analytics"
  }
}
```

- ▶ develop cloud resources labeling conventions^a
- ▶ export cloud billing to Big Query
- ▶ develop custom reporting using labels for grouping

tbd-2022z-1001-staging

Location	Storage class	Public access	Protection
eu-central2 (Warsaw)	Standard	Subject to object ACLs	None

OBJECTS CONFIGURATION PERMISSIONS PROTECTION LIFECYCLE

^aFinOps for data pipelines on Google Cloud Platform

FinOps - cost optimizations

- ▶ preemptible(spot) instances
- ▶ VM instance schedules
- ▶ autoscaling group of instances
- ▶ cloud storage lifecycle management
- ▶ serverless - but not because it's cheaper
- ▶ budgets and alerting
- ▶ organization/platform policies

- ▶ understand pricing models
 - ▶ what are the main cost drivers?
 - ▶ Pay-as-you-go or reserved

GitOps is a DevOps process characterized by:

- ▶ best practices for deployment, management, and monitoring of (containerized) applications
- ▶ a developer-centric experience for managing applications, with fully automated pipelines/workflows using Git for development and operations
- ▶ manage infrastructure and application configurations using Git (not only application code)

- ▶ application of the best practices of Agile methodology, DevOps to data processing
- ▶ automated deployments
- ▶ *data quality* and unit testing
- ▶ automated *metadata* generation e.g. lineage
- ▶ automated *security* via tagging (tag-based policies)

Figure: The three pillars of DataOps

Figure: Elements of ML systems

- ▶ adaptation of DevOps principles to ML domain
- ▶ standardized ML model lifecycle aka models factory
- ▶ pioneered in 2015
- ▶ various kinds of technical debts, e.g.:
 - ▶ pipeline jungles
 - ▶ configuration debt
 - ▶ data testing debt

Figure: DataOps vs DevOps vs ModelOps

- ▶ **AIOps** stands for **Artificial Intelligence for IT Operations**.
- ▶ Combines AI and machine learning to automate and improve IT operations.
- ▶ Aims to enhance monitoring, troubleshooting, and incident response in complex environments.
- ▶ a few examples:
 - ▶ k8sgpt - Kubernetes clusters triaging and troubleshooting with LLMs
 - ▶ LLM-powered automatic labeling, commit summaries, even code reviews
 - ▶ automatic test cases/ data quality tests generation

- ▶ Terraform is great...but have some limitations
- ▶ Terragrunt and Atlantis for more robust CI/CD processes - e.g. DRY principle - versions, variables
- ▶ modules vs stacks
 - ▶ radius blast
 - ▶ speed
 - ▶ resources lifecycle - e.g. compute vs storage

Automation to the rescue - git hooks

pre-commit – a framework for managing and maintaining multi-language pre-commit hooks.

```
+ tbd-20222-infra-internal git:(feature/ci-cd) × git commit -m "Check"
Terraform fmt.....Passed
Terraform docs.....Passed
Terraform validate with tfLint.....Failed
- hook id: terraform_tflint
- exit code: 2

TFLint in ./:
4 issue(s) found:

Warning: variable "group_id" is declared but not used (terraform_unused_declarations)

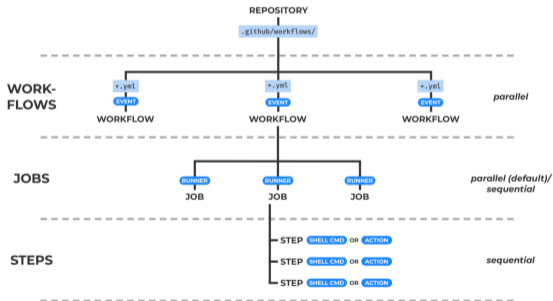

on variables.tf line 1:
1: variable "group_id" {

Reference: https://github.com/terraform-linters/tflint/blob/v0.35.0/docs/rules/terraform\_unused\_declarations.md
```

Automation to the rescue - Github Actions

GitHub Actions

```
name: Pull request workflow  
on:
```

```
pull_request:  
  branches: [dev]
```

```
jobs:
```

```
  pull-request:  
    runs-on: ubuntu-latest
```

```
    steps:
```

- **uses:** actions/checkout@v2
- **uses:** hashicorp/setup-terraform@v1

```
    with:
```

```
      terraform_version: 1.1.7  
    - name: Terraform fmt  
      id: fmt  
      run: terraform fmt -check
```

Github Actions – keyless authentication

- ▶ fine-grained scoping – e.g. GitHub repository, Organization
- ▶ short-lived credentials – by default 1 hour, greater security even if compromised
- ▶ minimal management overhead – no need for JSON service keys, short-lived tokens rotated every deployment

- ▶ static application security testing (SAST) tools like checkov, tfsec or terrascan
- ▶ policy-as-code
- ▶ support for many IaC technologies (e.g. Terraform, Docker files, Helm charts)

```
  _ | | _ _ _ | | _ _ _ _ |
 / _ | ' \ / _ \ | / / _ \ \ /
 | ( | | | / ( | < ( ) \ \ /
 \ _ | | \ \ \ \ | \ \ \ \ /
```

By bridgecrew.io | version: 2.0.1032

terraform scan results:

Passed checks: 26, Failed checks: 6, Skipped checks: 22

Check: CKV_GCP_27: "Ensure that the default network does not exist in a project"

FAILED for resource: google_project.tbd_project

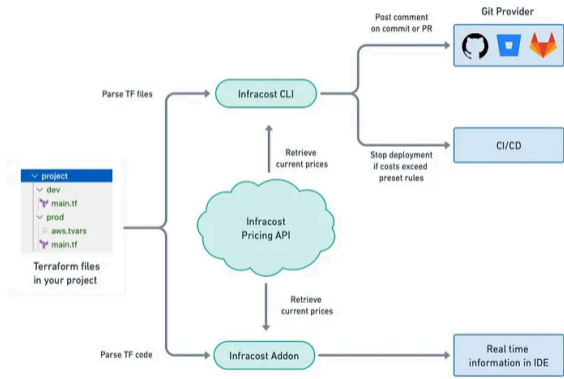

Error: File: /gcp_project/main.tf:5-12

Guide: https://docs.bridgecrew.io/docs/bc_gcp_networking_7

```
5 | resource "google_project" "tbd_project" ***
6 |   name           = "TBD $$$$local.project$$$ project"
7 |   project_id     = local.project
8 |   billing_account = var.billing_account
9 |   lifecycle ***
10 |     prevent_destroy = true
11 |   ***
12 | ***
```

Automation to the rescue - FinOps

- ▶ analyses Terraform code
- ▶ support for CI/CD and code editor
- ▶ unfortunately some data services - such as GCP Composer or DataProc still not supported :-)

Automation to the rescue - FinOps

Infracost Cloud cost estimates for Terraform in pull requests

#usage file

version: 0.1

resource_usage:

google_storage_bucket.tbd-staging-bucket:

storage_gb: 100

monthly_class_a_operations: 40000

monthly_class_b_operations: 20000

monthly_data_retrieval_gb: 1000

github-actions bot commented yesterday · edited

Infracost estimate: monthly cost will increase by \$147

Project	Previous	New	Diff
bdg-tbd/tbd-2022Z-infra-internal/plan.json	\$0	\$147	+\$147

▼ Infracost output

Project: bdg-tbd/tbd-2022Z-infra-internal/plan.json

+ google_storage_bucket.tbd-staging-bucket
+\$2.51

+ Storage (standard)
+\$2.30

+ Object adds, bucket/object list (class A)
+\$0.20

+ Object gets, retrieve bucket/object metadata (class B)
+\$0.01
